PRODUCT SERVICE BULLETIN

Subject: Incompatible Bearing Grease

Equipment: AC Gearless Machines Models 472, 475, 522, 525, 805, and 808

Date: Oct. 6, 2008

The user must follow the installation and maintenance manual, which indicates the proper grease to use. The manual also gives the recommended re-lubrication interval and the amount of grease to add based on the bearing size or machine size. All AC Gearless Machines use lithium base grease. The following greases are preferred: SKF LGEP2 or Great Wall general purpose lithium grease. If incompatible greases are mixed, the resulting consistency will change significantly and bearing damage due to lubricant leakage or lubricant hardening can result. Any questions pertaining to grease compatibility being used for re-lubrication can be directed to:
